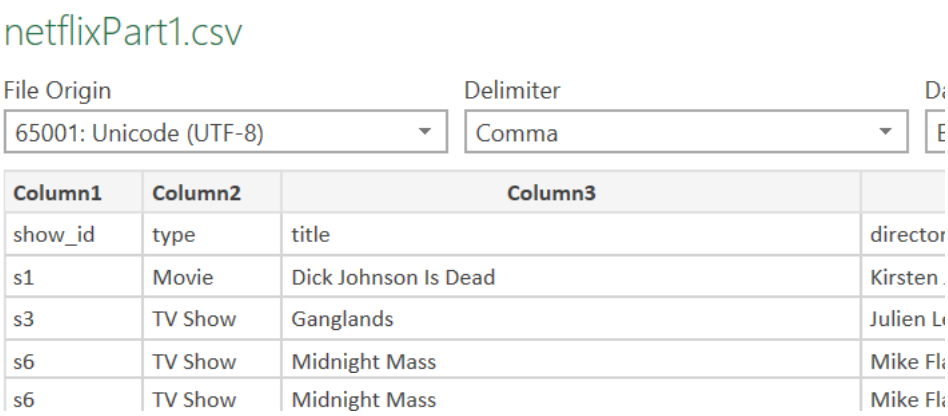
In this document, I will describe the process of cleaning the data of the Netflix-related dataset. For the sake of practice, even though it's a relatively small data set, I used methods as if it were much bigger data with many columns and rows.

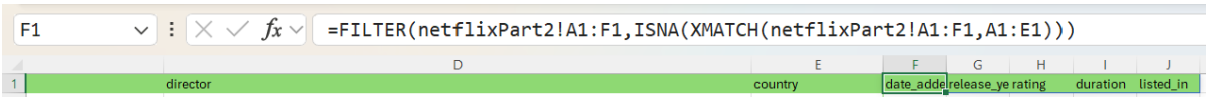
The dataset is divided into two CSV files named "netflixPart1" and "netflixPart2".

First of all, I made sure that the CSV files were encoded in UTF-8.

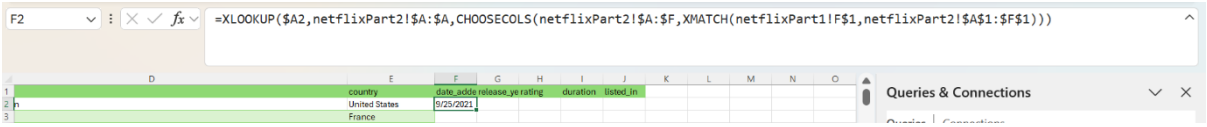


(I did the same for netflixPart1.csv)

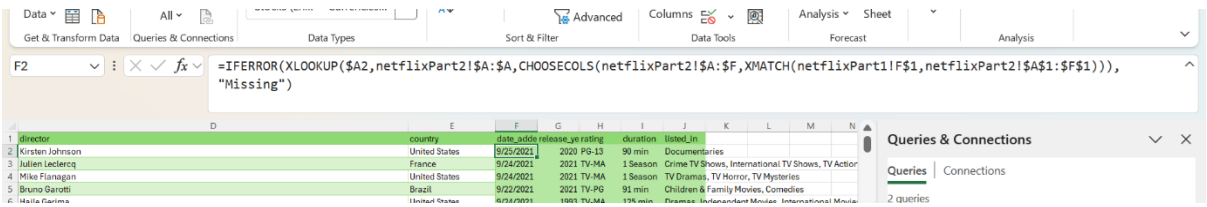
Now I will attach the header of "netflixPart2" to "netflixPart1"(only if there is no duplications)



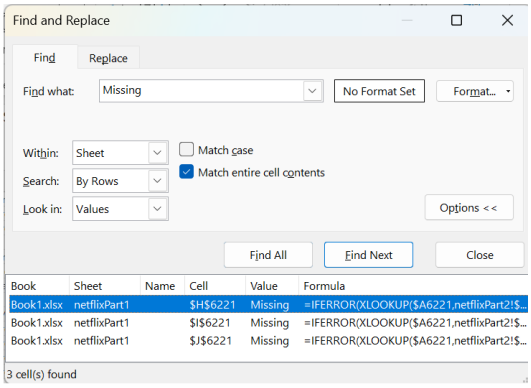
After I merge the two titles, I will start merging the content.



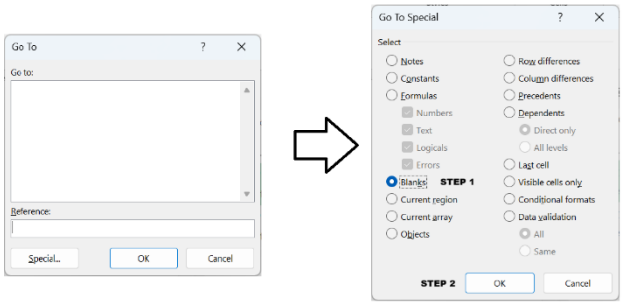
And now I will do Auto fill for the rest of the columns and rows(I also added “IFERROR”)



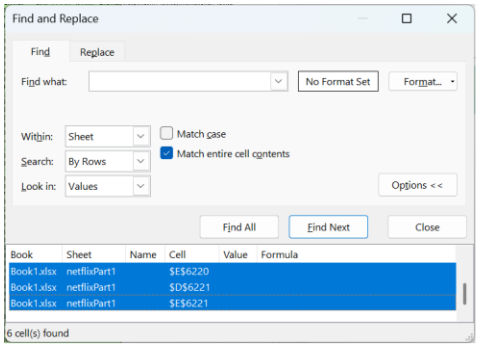
As you can see, there are some missing parts(#N/A or Blank) in the table. I will make notes about that.

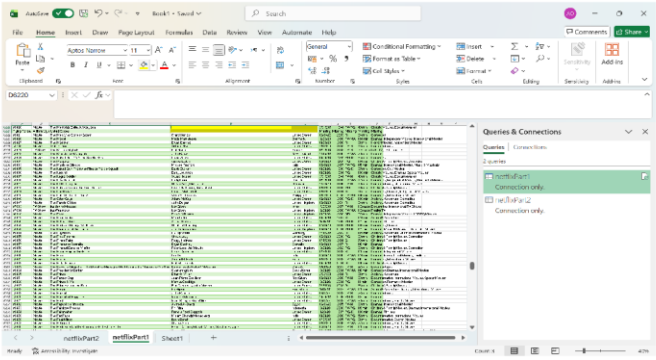


I'll do a little check to see if there are any blanks inside the raw data - Column A to E. now I'll will select all the data -> press Ctrl+G -> Special ->Blanks ->OK . After noticing that there are blanks, I will fill them with yellow in order to easily access them later through filters or conditional formatting.

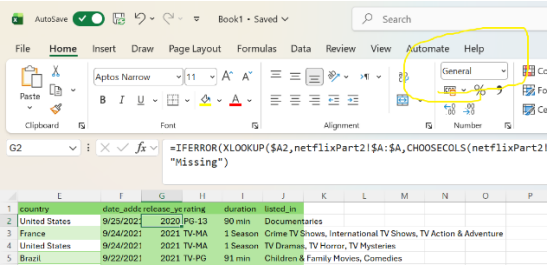


After noticing that there are blanks, I will fill them with yellow in order to easily access them later through filters or conditional formatting.





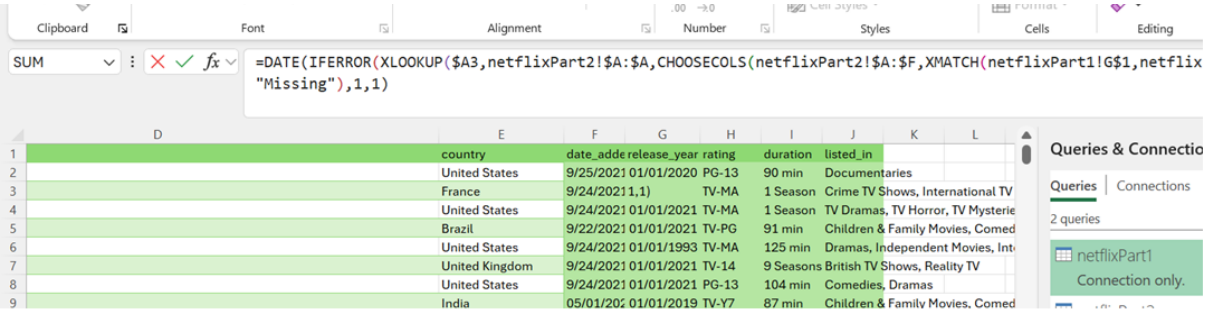
My team leader didn't get back to me about the Blanks, but he told me that he wants the format of the dates that appear in the data to be date and not something else. I noticed that the format is currently "general". Let's try changing it to "Date".



After I changed to date it became like this

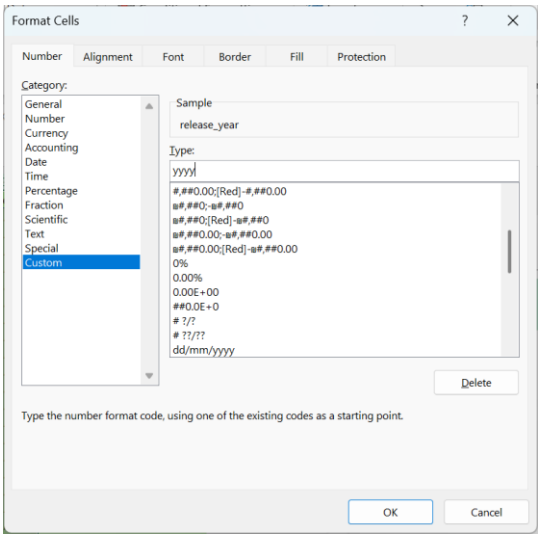
release_year
12/07/1905
13/07/1905
13/07/1905
13/07/1905
15/06/1905
13/07/1905
13/07/1905
11/07/1905
13/07/1905

So this becomes obvious that i need to do casting using the Date function.



Now I will change the format and I will have the “release_year” in Date format.

release_year
2020
2021
2021
2021
1993
2021



In addition to what was tested earlier, I also know that there are two features in which I cannot allow duplication, or at least need to be aware of those duplications– “show_id” and “title”. I will use conditional formatting and Filters to identify if there is duplication and if necessary, easily access those duplicate values.

	A	B	C	
1	show_id	type	title	director
222	s160	Movie	Love in a Puff	Pang Ho-cheung
395	s3997	TV Show	09-Feb	Not Given
417	s304	Movie	Esperando la carroza	Alejandro Doria
539	s5965	TV Show	09-Feb	Not Given
2927	s3963	Movie	15-Aug	Swapnaneel Jayakar
3287	s4523	Movie	22-Jul	Paul Greengrass
3639	s5034	Movie	FullMetal Alchemist	Fumihiko Sori
3821	s5319	Movie	Death Note	Adam Wingard
4262	s5966	Movie	22-Jul	Paul Greengrass
4263	s5967	Movie	15-Aug	Swapnaneel Jayakar
4858	s6706	Movie	Esperando La Carroza	Alejandro Doria
5363	s7346	Movie	Love In A Puff	Pang Ho-cheung
6857	s1271	TV Show	Sin senos sí hay paraíso	Not Given
8064	s5096	TV Show	Fullmetal Alchemist	Not Given
8263	s5752	TV Show	DEATH NOTE	Not Given
8670	s8023	TV Show	Sin Senos sí Hay Paraíso	Not Given

There is no duplication in "show_id" but there is a duplication in "title". Duplicates in the "title" column are not necessarily a problem but in some cases it can raise suspicions that the data is corrupted and of course I have to be aware of this. As you can see there are films that appear twice under the same director's name. There are also films that appear twice and in both cases the identity of the director is unknown.

I was given permission to delete records that are completely identical in all features (except show_id). But how I will identify those records? I will create another column and use the textjoin function to find the records that are identical in terms of the parameters except for "show_id".
